

Here's a look at how we handle Vestiaire Collective's image processing pipeline, from start to finish. From the moment their files land on FTP to the final delivery back to them, the whole process runs through our automated workflow with an average turnaround of around 65 minutes per batch.

Operational Scale & Output

We've processed over 4.5 million images for Vestiaire Collective till date. We handle roughly 200,000 a month and between 5,000 and 8,000 files on any given day. Every one of those goes through the same 12-step process below, from upload to delivery.

How It Works, Step by Step

■ Transfer 1 – 3 ■ Assignment 4 – 5 ■ Processing 6 – 7 ■ Review 8 – 9 ■ QC 10 – 11 ■ Delivery 12

Dashed lines connect the end of one row to the start of the next. Each step shows which phase it belongs to.

What Happens at Each Step

01 Client FTP Upload

Vestiaire Collective transfers their source image files to our shared FTP server.

Transfer

02 System File Download

Our platform picks up the transferred files from FTP and pulls them into the workflow automatically. No manual step needed here.

Transfer

03 Order Created

A new order gets created for the file batch. This is what keeps everything tracked and accountable from start to finish.

Transfer

04 Auto-Assign to Team

The order is automatically sent to the editing team. No manual handoff, no delay. It just lands where it needs to go.

Assignment

05 Distribute to Editors

Files are split evenly across all editors who are currently active. The system handles the distribution on its own.

Assignment

06 omnimage.ai Process

Each file is processed through omnimage.ai, which removes the background and saves the output as a PSD.

Processing

07 Download to PC

The processed PSD files are downloaded to the editor's PC automatically and are ready to review.

Processing

08 Editor Review

The editor goes through each file, makes sure it looks right, and moves the approved ones into their designated output folder.

Review

09 Output File Transfer

Our system picks up the completed files from the editor's output folder automatically.

Review

10 QC Review

Every file is checked in our own QC tool. Vestiaire can also use the approval flow to approve or reject any image before it moves forward.

QC

11 QC Approval

Once QC gives the green light, files are marked as approved and ready for delivery. Any that don't pass go back for a fix.

QC

12 Client FTP Delivery

Approved files are uploaded to Vestiaire's FTP delivery folder. The client picks them up from there.

Delivery

What Powers the Pipeline

FTP File Transfer

External

Vestiaire uploads their source files to our shared FTP server. Once retouching and QC are done, we upload the approved files back to their set delivery folder on the same server. Simple and fully automated both ways.

omnimage.ai

AI

Our AI processing platform powered by [omnimage.ai](#). Once a file reaches the processing stage, omnimage.ai handles background removal and outputs a clean PSD. It works at scale, consistently, without an editor having to touch each file manually.

Order Management System

Internal

The core of the whole operation. It pulls files from FTP, creates orders, splits work across active editors, and collects finished files from output folders. Everything runs on its own without any manual input.

QC Review

Human in the Loop

We use our own QC tool for quality review. Vestiaire gets a built-in approval flow where they can approve or reject any image directly. Nothing gets delivered without passing our QC check.
